

Firstly, a user having an account for this app can directly access by just logging into this app, whereas a user who is new to this app can click on the **Create new account** button so that they can able to access to this application.

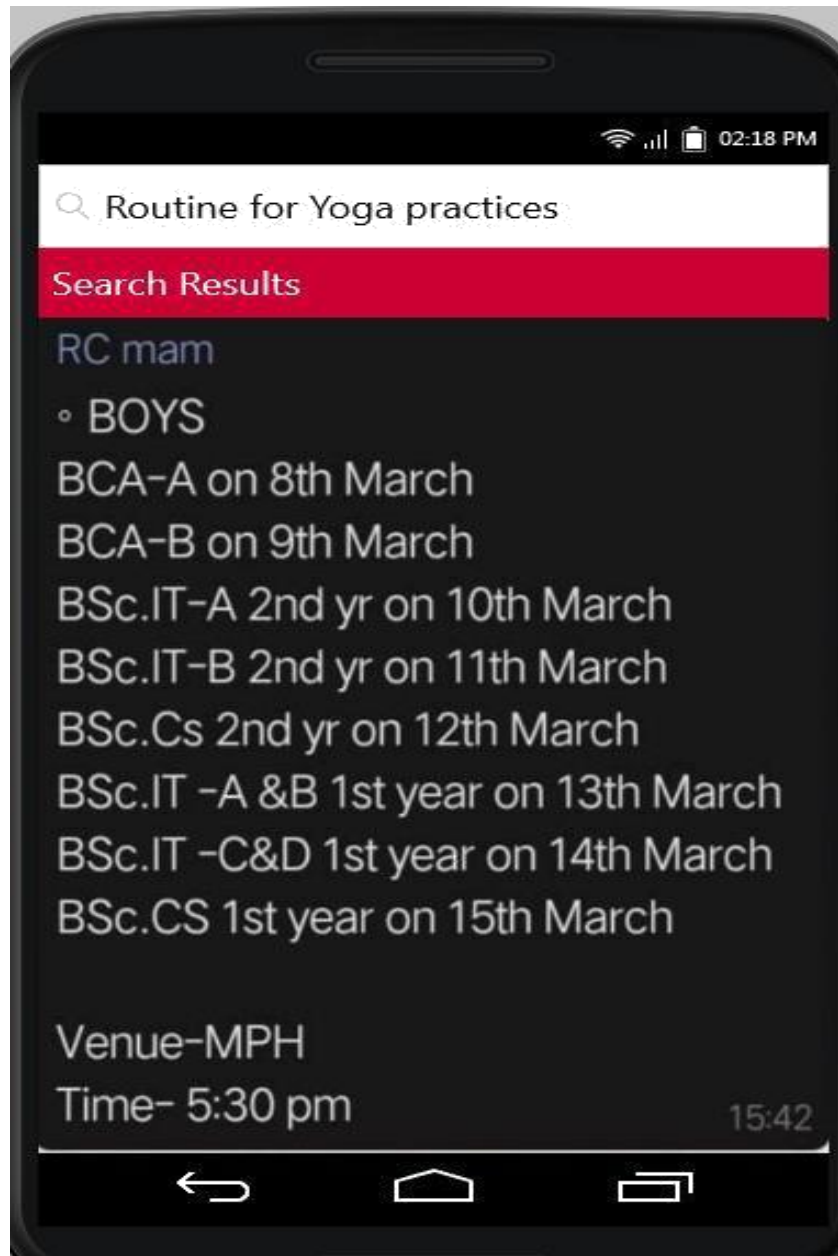

The above screenshot shows that a non-user or a new user should create a new account by filling up the form and click on the **Register** button after filling all the details.

This is the **Home page** of my application where a user can be able to view the information that has been posted by the other users. And also there is an option that they can post any important/urgent information that has to be reached to other users in this application. There are also other options where on **Home** a user can see the new notifications that notify for a new information and they can also logout or visit their **Profile** if they wish to change or update any information about them.

This is how a user can get notifications for new information that has been posted by the other users and through this they can able to keep updated.

The **Search** button allows a user to search for information that has been posted already but then if they wish to view it for another time if it is important or that need to be refer back.

This is where a user can either **Log out or** visit **User Profile** where they can logout if they wish to logout when they are not in need and also visit profile for updating new information and all.
